

Bywaf System Block Diagram

This diagram shows both live runtime flow and durable data flow. Live command execution moves left to right; audit, event, and artifact records flow downward into durable stores.

Key Flows

Live runtime flow

- Operator submits a command or script.
- Framework parses, expands, tests policies, and creates runtime IDs.
- Supervisor invokes commandlet runs in foreground or background.
- Commandlets use framework APIs for output, events, artifacts, processes, and signals.

Durable audit flow

- Runs publish normalized events into SQLite.
- Framework requests and outcomes are stored as events.
- Artifacts store content while the main DB stores metadata and hashes.
- Reports, searches, and future UI views derive from durable records.
