

Bywaf System Dataflow Diagram

This diagram focuses on data movement and durable records. It complements `SYSTEM_BLOCK_DIAGRAM.pdf`, which focuses on major system components.

Dataflow Guarantees
Durability

Traceability

- Runtime entities receive local IDs and durable serials.
- Events are stored before they become reusable audit evidence.
- Artifacts carry hashes in both artifact storage and main metadata.

- Inputs, variable expansion, and `@file` expansion are auditable.
- Framework requests produce explicit outcome events.
- Reports and future frontends derive from events, not terminal scrollbar.
